AB	Title laminate material with low prodn. cost comprises a spunbond polypropylene nonwoven fabric, and a monolithic, acrylate/polyester breathable , polymeric film which is extrusion-coated onto the nonwoven fabric layer. The breathable coating exhibits substantial impermeability to liq., water, and to air, while exhibiting significant permeability to water vapor. Thus, a spunbond polypropylene nonwoven fabric was extrusion-coated with a compn. comprising Et acrylate-Me acrylate copolymer 76%, PL 380 (block polyester) 20%, and UV-stabilizer 4% to give laminated fabrics, showing strip tensile strength (machine direction/cross direction) 55/43.5 N/cm, and permeance (at 22.degree. and 50% R.H. Perms) 7.5.

PRAI WO 2002-IT87 20020214

AB The present invention relates to a hygienic absorbent product for babies or incontinent adults, comprising an absorbent layer and an outer breathable layer. Said outer layer is formed of a laminate compressing a **monolithic** polymeric material **film** and a fibrous layer, wherein said **monolithic** polymeric material is a biodegradable and compostable aliph.-arom. copolyester. The copolyester comprises up to about 30% by wt. terephthalic acid monomer and a fibrous layer is made of a **polypropylene** nonwoven **fabric**.

AB The barrier **fabrics** (A) comprise a fine-denier spunbonded layer
 comprising multiple thermoplastic filaments having denier per filament
 0.7-1.2 and a barrier layer material deposited uniformly onto the
 fine-denier spunbonded layer, and have the layers consolidated to form a
 composite **fabric** having ratio (R) of the hydrostatic head of the
fabric to the basis wt. of the barrier layer .gtoreq.4.9 cm/g-m2,
 or the barrier **fabrics** comprise A **fabrics** having the
 thermoplastic filaments consisting of polyethylene and/or

polypropylene (I), or the barrier fabrics comprise A fabrics having the thermoplastic filaments consisting of polyolefins and/or polyesters, or the barrier fabrics comprise A fabrics having the barrier layer comprising melt-blown webs, cellulose pulp, microporous films, or monolithic films. The barrier fabrics are useful for waste-containment garments, medical gowns, industrial protective garments, and battery separators. A melt-blown layer of spun fibers from I (Achieve 3854) with basis wt. 8 g/m2 was sandwiched between 2 spunbonded layers of I fibers with basis wt. 17 g/m2 to give a composite nonwoven fabric exhibiting tensile strength (Grabs) 8102 and 6472 g/cm, resp., in the machine and transverse directions, hydrostatic head value 49 cm, and R 6.1.

AB Title laminate material with low prodn. cost comprises a spunbond **polypropylene** nonwoven **fabric**, and a monolithic, **acrylate/polyester breathable**, polymeric **film** which is extrusion-coated onto the nonwoven **fabric** layer. The **breathable** coating exhibits substantial impermeability to liq., water, and to air, while exhibiting significant permeability to water vapor. Thus, a spunbond **polypropylene** nonwoven **fabric** was extrusion-coated with a compn. comprising Et **acrylate**-Me **acrylate** copolymer 76%, PL 380 (block **polyester**) 20%, and UV-stabilizer 4% to give laminated **fabrics**, showing strip tensile strength (machine direction/cross direction) 55/43.5 N/cm, and permeance (at 22.degree. and 50% R.H. Perms) 7.5.

AB	The thermoplastic film in the title sheets comprises at least 50 % by wt. of a polymer material from the group of block copolyether esters, block copolyether amides and polyurethanes. The substrate in the title sheets comprises a fibrous web of at least 50 % by wt. of polyolefin fibers. The composite sheet exhibits a peel strength of at least 0.1				

N/cm, a dynamic fluid transmission of less than about 0.75 g/m² when subjected to an impact energy of about 2400 J/m², and a moisture vapor transmission rate, according to the desiccant method, of at least 1500 g/m²/day. The absorbent article comprises: (a) a topsheet; (b) a backsheet; and (c) an absorbent core located between the topsheet and the backsheet; wherein the backsheet comprises the nonporous, substantially fluid impermeable moisture vapor permeable composite sheet material described above. The composite sheet material is oriented such that the film layer of the composite sheet material faces toward the absorbent core. The absorbent article may comprise a disposable diaper.
